CASSETTE FLOORING

Eastland recently launched another manufacturing division with the commencement of cassette floor system manufacturing. Our first major project was 6 units in Lismore and it was a big success.

The installation time saved with cassette floor systems was well noted. It only took 30 minutes per unit to get a completed floor.

Floor Cassette systems provide a fast, cost effective way to install a complete structural flooring system for both ground floor and upper storey applications.

They can save days of installation. The precision design and engineering allow for greater quality control and spans up to 10 metres.

There is reduced cut and fill and reduced working at height risks by installing complete upper storey cassettes from below.

Cassette flooring is a winner both in terms of speed and safety.

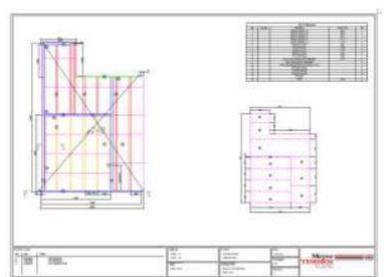

6 units of cassettes arrive at site

POSI-STRUT TRUSSES

Eastland's posi strut flooring and roofing is rapidly gaining popularity.

Our clients have commented on the benefits of the 'open web' design, which provides great access for services like plumbing, electrical, heating and air conditioning without the need to modify the joist. They are also strong, versatile and light weight!

Posi Struts deliver the ultimate in design versatility especially where height restrictions apply.

They can even be curved to create a dynamic roof line effect.

The easy access for services on-site also means the structural integrity of your design can't be compromised; drilling through solid timber beams isn't the ideal scenario!

Eastland's Posi Struts are a truly customised, totally engineered flooring system, which combines the versatility of timber with the strength of steel.

Other advantages include increased floor stiffness & reduced squeaky floors. As well as the ability to achieve larger internal room sizes

GOING GREEN

‘Cause it's all about that Waste ‘bout that Waste!

Thanks to Meyer Timber Eastland will have waste in the bag.

Eastland will be reducing our carbon footprint and going green by switching to timber waste recycling through the use of FIBC bags and manoeuvre nesting bins with fork lift tine lifting slots & lockable wheels.

The full bags will be freighted back to Meyer Timber to be sent to the recycling plant. The waste from the framing timber is recycled into products such as particle board.

WASTE MANAGEMENT MATERIALS HANDLING
